

Execution Legitimacy

Evaluating legitimacy at the moment execution occurs.

Authority Does Not Guarantee Legitimacy

Authority permits execution.

Execution legitimacy determines whether that authority remained valid when consequence was created.

EXECUTION CREATES A NEW GOVERNANCE QUESTION

Traditional Governance asks
Can this execute?

Runtime Governance asks
Should this execution still be occurring?

Execution changes the governance
question.

RUNTIME GOVERNANCE EVALUATES EXECUTION

Runtime Governance evaluates execution across four dimensions:

- Authority remained valid.
- Delegation remained continuous.
- Context remained valid.
- Execution remained legitimate.

Runtime Governance evaluates execution as a composite governance event.

No single governance control can independently determine execution legitimacy.
Execution legitimacy emerges from the combined evaluation of authority, delegation, context, intent, and execution.

ACCOUNTABILITY REQUIRES EXECUTION VALIDATION

Distributed systems execute from many local authority states.

The enterprise experiences one consequence

Accountability requires validating execution, not merely authorizing it

EXECUTION CREATES CONSEQUENCE ONCE

Execution creates consequence once.

Accountability requires proving that authority remained legitimate when that consequence was created.

Traditional Governance authorizes execution.

Runtime Governance validates execution legitimacy.
